

How to use the A&O Trading Terminal

A short guide for members. Set your plan once, then let the desk show you what fits your rules: levels, zones, flow and tests you can run before you trade.

Alpha & Omega Analytics · tradewithao.com

Education only. Not financial advice.

START HERE

Your terminal, not a signal room.

A&O does not send buy and sell alerts. You decide which tickers, strategies, prices and risk you allow. The desk scans the market for setups that fit those rules, shows the levels behind each one, and lets you test ideas before you risk a dollar. You place every trade yourself, at your own broker.

Get set up in three steps

1

Log in

Go to **dashboard.tradewithao.com** and choose **Continue with Whop** using the account you paid with. No separate password.

2

Set Your Plan

A 60-second setup, one question at a time. Your answers decide which styles, prices and sizes you see on every screen.

3

Sync your broker (optional)

Open **My Portfolio** and connect through SnapTrade. It is read-only, so cards can check if a contract fits your account. A&O never places trades.

Where things live

MENU GROUP	SCREENS
Today	Morning Brief, Dashboard, My Portfolio, Top Setups, Levels & Session, My Watchlist
Desks	Alpha Shares, Alpha Flow, Flow Tracker, Dealers, VEX Velocity, Market Tide, Move Radar, IV Desk
You	Alpha Performance, Learn, Alpha News, Rule Lab, Strategy League, Track Record, Connect to AI
Top bar	Profile (and Your Plan), Simple Mode, Light/Dark, How to use, ♦ Ask A&O

Write your rules once. The desk follows them.

Your Plan is ten short questions. They are your rules, not advice from A&O. Change any answer later from **Profile**.

QUESTION	WHAT IT CHANGES
Goal and experience	Starting suggestions for which styles fit you. New traders start with fewer, slower styles.
What do you trade?	ODTE, 1DTE, Weekly, Monthly, LEAPS, Spreads, Writing, Shares. Styles outside your plan are dimmed on each ticker, never hidden.
Budget per trade	What you usually put into one trade. Cards check each contract against it.
Price per contract	Only contracts in your range show on your desk. Price is per share: \$3.00 means \$300 a contract.
Max loss per trade	The most you are willing to lose on one trade. A&O sizes every contract to this number.
Daily limits, first 15 minutes, stop rule, note	Max trades per day and open at once, whether you skip entries before 9:45 AM ET, how you exit, and a personal reminder.

Where most people start: \$500 to \$1,000 per trade. Pick that range on the budget step, and the max loss step offers \$100, \$200, \$300 or \$500 (10% to 50% of \$1,000). Many traders choose 20%, about \$200 a trade.

About cheap contracts. Contracts priced under about \$1.00 to \$1.50 have a low chance of ending in profit. They need a large move to pay off, and time decay works against them fast. A&O doesn't show lottos.

A simple way to run your day on the desk.

Morning Brief: the overnight read, the key line for SPY and the futures tape in one minute.

WHEN	OPEN	WHAT TO LOOK FOR
Before the bell	Morning Brief	The overnight read, the gamma flip that matters today, the strongest reads, and the futures tape. Read time is about a minute.
Planning	Levels & Session	The prices that matter today, and the hours the model doesn't trust.
First 15 minutes	Nothing new, if you chose that rule	Cards flag contracts during the opening window so you can wait for the first range to form.
During the session	Top Setups, My Watchlist	The strongest setups ranked by model score, and your own tickers. Click any ticker to open its setup cards.
Have a question	♦ Ask A&O	Levels, flow, expected move or a full bull, base and bear plan for any ticker.
Before you enter	The ticker's cards	Inside your limits? Where is the invalidation? What is the next level? Then decide at your broker.
After the close	Alpha Performance, Track Record	Your trade journal, and how the desk's picks did on the same exit plan.

When the market is closed, screens show each name's last read from the session with the time it was taken, so you can plan for tomorrow.

Zones, not calls.

Click a ticker anywhere to open its pane. The tabs across the top are trading styles (0DTE, 1DTE, Weekly, Monthly, LEAPS, Spreads, Writing, Shares). Styles outside your plan are dimmed. Each tab shows three cards: **Patient**, **Balanced** and **Momentum**.

ON THE CARD	WHAT IT MEANS
Plan / Contract score	How well this card lines up with A&O's criteria and your plan, out of 100. It is not a probability of profit. Setup shows the ticker's own setup score for comparison.
Inside your limits	The card fits your budget, price range and max loss. If it doesn't, the card says why.
Zone	The price area this approach is built around. "Price is in the zone" means the stock is there now.
Invalidation	The level where the idea is wrong. If price closes past it, the setup no longer holds.
Next level	The next level the setup is built toward, from the desk's dealer levels.
Valid entry, Profit level, Stop level	On options tabs: the price range the model found the contract in, and the exit plan levels.
Reasons	Short chips such as "Near dealer support" or "Reward/risk 4.3 : 1". Green helps, yellow is a caution.
Open gaps	Unfilled price gaps near price, read on the chart that matches the tab: 15 minute for 0DTE, 30 minute for 1DTE, 1 hour for weeklies, daily for monthlies, LEAPS and writing. Each comes with how often that ticker's gaps actually filled.

No edge? It says so. When the model sees nothing worth taking, the pane reads "No setup. You don't have to trade." Use **Explain this setup** and **How to read this** for a plain-English walkthrough.

Where hedging may pin, stall or speed up price.

Dealers: the SPY game plan with the switch zone, call walls, put walls and the king node.

Call wall

A strike with heavy call positioning above price. Rallies often stall or slow there.

Put wall

A strike with heavy put positioning below price. Dips often find support there.

Gamma flip / switch zone

The line between calmer and faster markets. Above it, dealer hedging tends to dampen moves. Below it, moves tend to speed up.

King node

The single largest exposure strike. Price is often drawn toward it, especially into expiry.

Positive vs negative gamma

Positive: dips get bought and rips get sold, so expect chop. Negative: hedging adds to the move, so expect bigger swings.

Bull, base and bear

The game plan writes each path as a level to reclaim or lose, then the next targets. Copy it with one click.

VEX Velocity (Desks)

Vanna exposure by strike for the front, weekly and monthly expiries of SPY, QQQ, SPX and IWM, and how fast each node is changing over 1, 5, 10 and 15 minutes and 1 and 4 hours. Click a cell for the strike card. A node that keeps growing shows where positioning is building. Fast nodes appear during market hours once there is an hour of history.

Switch between **Heatmap**, **Walls & flip** and **Index Heat**, pick SPX, SPY, QQQ, IWM or NDX, or type any ticker. **Trinity** checks whether SPX, SPY and QQQ agree.

Ask the desk anything.

Click **Ask A&O** in the top bar. Type a ticker in the **\$** box, pick your timeframe (Scalp, Day, Swing, Position) and ask in plain English. Answers come from the live desk and show where they came from, so you can open that screen and check.

Shortcuts

<code>/levels SPY</code>	Key dealer levels
<code>/plan SPX</code>	Bull, base and bear game plan
<code>/move NVDA</code>	Expected move, IV level and earnings
<code>/flow NVDA</code>	Biggest prints
<code>/tide</code>	Calls vs puts premium today
<code>/trinity</code>	Do SPX, SPY and QQQ agree?
<code>/help</code>	What Ask A&O can do

Plain-English questions

<code>any ARM calls today?</code>	Recent big prints on that ticker
<code>what stocks are at the golden cross?</code>	Scans the desk's names with Rule Lab's rule

Under a ticker answer, **Pick a style** (0DTE, 1DTE, Weekly, Monthly, LEAPS, Spreads, Writing, Shares) opens that ticker's setups in that style.

Answers can be wrong. Check the source link before you act on anything.

Test it before you trade it.

Pick a ticker and a rule, such as "Closes above the 200-day", "Closes above both the 50 and 200-day", "Golden cross" or "RSI(5) closes under 20", then press **Test it**. The lab replays the rule on up to five years of that stock's own daily bars.

Rule Lab.
Test a simple rule on a stock's own history before you trade it.

TICKER: **NVDA** RULE: **Closes above the 200-day** **Test it** Save rule

NVDA · Closes above the 200-day
Not true on the last close (Oct 2, 2026).

HIGHER 10 SESSIONS LATER

7 of 7 have 10 sessions of history

MEDIAN MOVE
+11.2%
after 10 sessions · +9.9% after 20

INSIDE 10 SESSIONS
+11.4% / -0.8%
median best rise / worst drop. Calls need the rise, puts the drop.

NVDA: "closes above the 200-day" happened 7 times in 5 years. 10 sessions later it was higher 86% of the time (7 scored), with a median move of +11.2%. Inside those 10 sessions the median best rise was +11.4% and the median worst drop -0.8%. That is a small sample, so read it as a rough guide.

DATE	CLOSE	+5	+10	+20	BEST 10	WORST 10
Jul 30, 2026	\$195.04	+12.3%	+15.5%	+16.9%	+16.5%	0.0%
Apr 8, 2026	\$182.08	+9.2%	+11.2%	+14.1%	+11.4%	-0.8%
May 13, 2025	\$129.93	+3.4%	+3.8%	+9.9%	+5.7%	-0.6%
Feb 5, 2025	\$124.83	+5.1%	+12.2%	-11.4%	+14.9%	+0.1%
Jan 28, 2025	\$128.99	-8.0%	+3.0%	+1.8%	+4.7%	-12.4%
Jan 13, 2023	\$16.90	+13.6%	+13.4%	+28.9%	+22.1%	-1.0%
Dec 12, 2022	\$17.54	-7.3%	-19.5%	-8.7%	+7.2%	-19.8%

Built from daily bars. Past results do not predict future ones. Education only, not financial advice.

Higher 10 sessions later

How often the stock was higher ten trading days after the rule fired.

Median move

The typical move after 10 and 20 sessions. Half the cases did better, half did worse.

Inside 10 sessions

The typical best rise and worst drop along the way. Calls need the rise, puts need the drop.

Check the sample size. "7 of 7" is a small sample, so read it as a rough guide. Past results do not predict future ones. Save rules you like, and the lab checks them against each new close.

Strategy League

Twelve A&O rules trade a paper account every trading day at 3:45 PM ET. The board ranks what they actually filled, and strategies that lose too much get benched.

Big money moves, in plain English.

Alpha Flow shows the big options prints on the tape. Search any ticker, like **\$MSTR** or **\$DRAM** , to see its biggest prints, calls vs puts and who was buying or selling. **Flow Tracker** then follows the biggest prints after they hit the tape, so you can see which ones worked.

COLUMN	HOW TO READ IT
Read	Bullish or bearish, from the side that traded. Buyers gain when the price rises, sellers gain when it falls.
Size, Entry, Now	Contracts and premium at the print, the average entry, and the price now.
Change, Per contract	The result from the trader's side, in percent and dollars per contract.
Status	Open, OI down since print (open interest fell, so some of it may have closed), or Expired (valued at intrinsic on the expiry close).

Use **5d, 10d, 20d, 30d** to change the window. The summary shows how many prints are up, the median change and how many are in the money now. Big flow is information, not a signal to copy.

Your results, your book, your people.

Alpha Performance

Your trade journal. Every trade you track, with what worked and what to fix. Use it after the close to see whether you followed your own plan.

My Portfolio

Your whole book in one place, read by the desk: every stock with an add zone, trim zone or hold read, news and insider buys and sells on each holding, and **your options** lined up against the desk's 1 to 5 read with days to expiry. Connect your broker through SnapTrade, read-only. A&O never sees your password and cannot place trades.

Community

Open the Community bubble to talk with other members. Type a ticker like `$TSLA` or a contract like `TSLA 400C 10/17` and it becomes a tag. Anyone can click it to open that ticker and check if it fits their own plan and account.

Levels & Session

A quick snapshot of the day: where price sits between the put wall, gamma flip and call wall, what happens if it breaks either way, and the hours the model doesn't trust.

Public Track Record

Each trading day at 10:05 AM ET, A&O records what the desk's model found and tracks it as a paper trade on the same exit plan the cards show: +30% profit level or -30% stop level, checked every 15 minutes. Winners and losers both stay, nothing is backfilled, and anyone can see it at tradewithao.com/record. The record started in October 2026, so give it a few weeks before reading much into it.

Ask Claude, ChatGPT or Cursor about your tickers.

Open **Connect to AI** under You. Copy the server URL into your AI app and sign in once, or use a key for agents and scripts. Then ask things like "What is the SPY game plan today?" and your AI answers with the desk's live data and the time it was pulled.

- **Options-first:** dealer levels, gamma flip, expected moves, flow and tide for ODTE, weeklies and swings.
- **Read-only and private:** your AI reads the desk. It never sees your broker login and never places a trade.
- **Try it now:** the page has sample questions you can run before you connect anything.

Words you'll see on the desk.

ODTE / 1DTE	Options that expire today / the next trading day. The fastest and riskiest styles.
Expected move	How far options are pricing a stock to move by an expiry, from the at-the-money straddle.
GEX / DEX	Gamma and delta exposure: how much dealer hedging changes as price moves.
VEX	Vanna exposure: how dealer hedging changes when implied volatility moves.
IV	Implied volatility. High IV makes options expensive, so spreads or writing may fit better.
Model score	How well a setup lines up with A&O's criteria. Not a probability of profit.
Invalidation	The level where an idea is wrong.
Market Tide	Calls vs puts premium across the market today.
Move Radar / IV Desk	Which names are pricing big moves, and where options are cheap or expensive.
Paper trade	A tracked trade with no real money, used for the Track Record, Strategy League and your own tests.

Ground rules

1. **You make every decision.** A&O is education and tools. It is not a broker-dealer or investment advisor and does not give personal advice.
2. **Size to your max loss.** Decide what you can lose before you enter, and let the cards size to it.
3. **Respect the invalidation.** If price closes past it, the setup is over.
4. **Skip the lottos.** Contracts under about \$1.00 to \$1.50 rarely pay off.
5. **Confirm at your broker.** Always check the live price, the contract and the expiry before you place an order.

Need help? Open **Learn** for short lessons on every screen, click **? How to use** in the top bar, or ask in the Community.

Options involve substantial risk and are not suitable for every investor. Paper and historical results are hypothetical and do not predict future results. Education only, not financial advice.
